

# SECURITY

## Your complete security toolkit

We employ a defensive, in-depth approach to security with safeguards that encompass all of our people, processes, and technologies. We assess our security monitoring, capabilities, and responses on an ongoing basis to ensure we are keeping up with the evolving cybersecurity landscape.

Our choice of architecture includes technologies such as default encryption in our cloud and offsite backup and recovery solutions. This is consistent with our culture of compliance to keep data safe, secure and private.

- Daily Log Review
- File Integrity Monitoring
- Web Application Firewall
- Two-Factor Authentication
- Vulnerability Scanning
- Antivirus
- Patch Management
- Distributed Denial of Service
- Intrusion Detection System
- Intrusion Prevention System
- SSL Certificate
- Encryption

**Secure people, process, technology** Administrative security includes our independent annual audits, hiring policies, staff training and back-office processes that protect sensitive data

**“Keep out” policy enforced** Physical security means only authorized personnel should have limited access to locked server racks, suites and cages

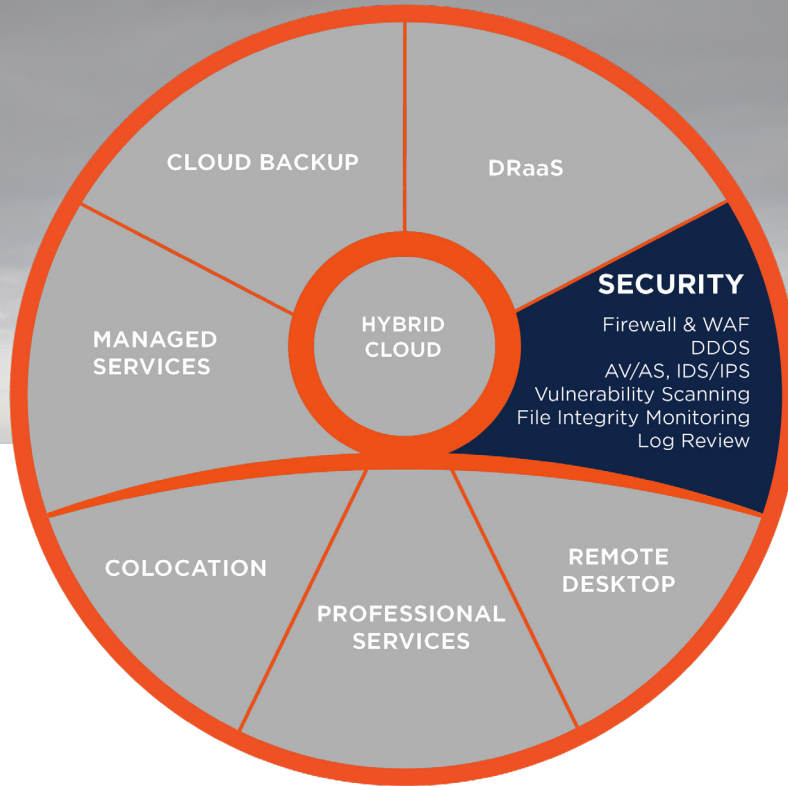

**Technical security at the highest level** Technical security, such as encryption, two-factor authentication, and intrusion protection are core safeguards of sensitive data

**“The fact that OTAVA manages all our production infrastructure for us has helped big time. Since we have moved [our infrastructure] over, our experience with OTAVA has been smooth.”**

Chandil Pinchi  
CIO
